

VULSCAN PVS: YOUR TICKET TO PORTABLE VULNERABILITY SCANNING

Vulnerability scanning has become a crucial component of network security. It usually involves permanently installing an appliance on a network and configuring it to run at specific regular intervals.

Sometimes, however, you need an ad-hoc or one-time vulnerability assessment where you don't want to permanently install a scanning appliance on the network. The VulScan PVS add-on subscription allows you to create a physical appliance to perform network vulnerability scans on multiple networks without consuming VulScan permanent site licenses.

We created a special add-on subscription to the VulScan platform that gives you the option to create a portable vulnerability scanner and use it for ad-hoc scans on as many sites as you wish for a low monthly fee.

Uses

MSPs can use VulScan PVS to perform ad-hoc vulnerability scans for prospecting and as a part of one-time paid security assessments.

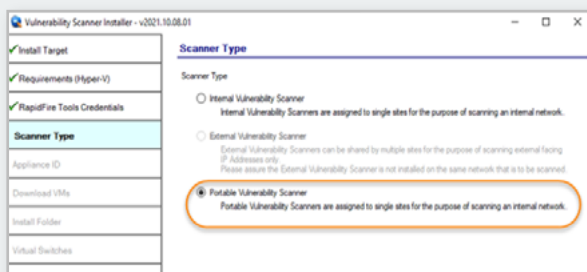

Internal IT Pros can use VulScan PVS to perform vulnerability scanning for temporary offices and for ad-hoc scans after major network changes.

Works Seamlessly with the VulScan Platform

VulScan PVS allows you to conduct mobile vulnerability scans when added to the VulScan platform. VulScan is the cornerstone of Vulnerability Management-as-a-Service and increased profitability.

VulScan delivers:

- ✓ Internal and external vulnerability scanning
- ✓ Unlimited asset scans per site
- ✓ Multi-tenant, cloud-based scanner management portal
- ✓ False positive management
- ✓ Automatic PSA ticket creation

How It Works

Simply install the VulScan PVS appliance software on your own hardware and take the physical appliance from one site to another. Each time you plug it into a new network, you can reassign it to a new site in your web-based portal to set up the scan tasks and capture the scan data.
